# FARM SEEDS

## Ensilage Corn of all kinds—Market Prices.

**ALFALFA OR LUCERNE**—The most valuable of all the clovers. Grown largely as a forage plant. It is one of the most nutritious of foods for horses or cattle. It requires a rich and well-drained soil. It is a great drought resister, as it has a tendency to root very deep. When thoroughly set it can be cut three or four times in one season. It should be sown in well-prepared and deeply plowed soil at the rate of 25 to 30 lbs. per acre broadcast, 20 lbs. drilled. It should be cut when the plant is coming into bloom. The Alfalfa we sell is government tested and guaranteed free from trefoil and dodder. Weight, 60 lbs. to bushel.

**ALSIKE**—Here is a clover that does well in cold, stiff soils and marshy lands where other clovers would fail. It can also withstand severe cold. In appearance it resembles both the red and white clovers, but is far more hardy than either. It is an enormous yielder and particularly valuable for sowing with other clovers and grasses. Sow in spring or fall at the rate of 8 lbs. per acre when used alone. Weight, 60 lbs. per bushel.

**CRIMSON CLOVER**—Valuable for feeding green and also for hay. It is a fine soiling crop and particularly valuable for turning under. Sow in spring or summer at the rate of 12 to 15 lbs. to the acre if used alone. Sixty lbs. per bushel.

**WHITE DUTCH CLOVER**—A dwarf variety of a creeping nature, resisting extremes of heat and cold, but prefers moist ground. It is valuable in permanent pastures and affords most excellent feed for cattle and sheep. It is also used largely in lawn grass mixtures. Sow at the rate of 3 lbs. to the acre if used alone. Sixty lbs. to bushel.

**TIMOTHY**—The best known and most valuable of the hay grasses. Particularly adapted to moist, loamy or clayey soils, and not so well suited to light, sandy soils. It should be cut when flowering. We shall keep the best Western grades, also State Timothy. Sow at the rate of one-half bushel to the acre if used alone.

Prices subject to change without notice.

**KENTUCKY BLUE GRASS**—One of the best known native grasses. Succeeds in almost any soil, dry, rocky, sandy, or gravelly. Will stand protracted dry weather and hot suns. It makes a most valuable pasture grass, and it is highly esteemed in lawn grass mixtures. Sow at the rate of 3 bushels to the acre for pasture or meadow. Weight, 14 lbs. to bushel.

**RED TOP**—A hardy grass. Does the best on moist soils. Good for low, wet meadows, but can adapt itself to dry conditions. It is permanent in its nature and in good demand for pasture mixtures. Chaff Red Top runs 14 lbs. to the bushel; use three bushels to the acre if sown alone. Fancy Recleaned Red Top runs 32 lbs. to the bushel; use 20 lbs. to the acre if sown alone.

**RAPE (DWARF ESSEX)**—Makes an excellent feed for sheep, also a good soiling plant. Sow in May, or it may be sown in June or July. If sown in drills, 3 lbs. to the acre. If sown broadcast, 5 lbs. to the acre.

We carry in stock a line of Seed Barley, Oats, Rye and Wheat, on which we expect to meet the market for the same quality of goods.

**JONES' IMPERIAL LAWN GRASS**—This mixture is made up of the finest and most permanent grasses especially adapted to lawns, and as the seeds are free from chaff this mixture will run 20 lbs. to the measured bushel. Use 1 quart to 200 square feet, or 4 to 5 bushels per acre.

**Flower Seed of all kinds. Write for Prices.**
